COMPUTERWORLD.COM

Let's leave the hardware where it is.

A software-based VoIP solution from Microsoft is a whole new way to look at telephony.

As it turns out, that important move to VoIP isn't about ripping and replacing or big, upfront costs. That's because it's no longer about hardware.

It's actually about software.

That's right. Keep your hardware your PBX, your gateways, even your phones. Add software. Software that integrates with Active Directory.* Microsoft* Office, Microsoft Exchange Server, and your PBX. Simply maximize your current PBX investment and make it part of your new software-based Volf Solution.

Because what you have is good.

What you have with the right
software is even better. Learn more

Philly Blockbuster

F A WINDSHIELD WIPER can inspire a major motion picture, then a computer cooling device is surely the stuff of Hollywood movies too.

Perhaps you saw Flash of Genius, the film about Rob-

ert Kearns, inventor of the intermittent windshield wiper, who waged a seemingly hopeless patent-infringement battle against the Big Three automakers. Equally unlikely is the story of Bill Corcoran, an MIS director in suburban Philadelphia. I talked with Corcoran last week, and he recounted a tale of persistence in the face of overwhelming odds that began with a hrainstorm he had in the late '80s when he was working

at a computer store. A lot of computers of various hrands were failing, and he recognized that a heat problem was the culprit. Corcoran came up with an idea for an auxiliary cooling fan that would slide into a drive bay on any computer without any retooling, and he reamed up with his huddy Gary Smith, a design engineer, to create a prototype. They filed for a patent that was ultimately granted in 1999.

In 2003, Corcoran discovered that two retail chains - Best Buy and Micro Center - were selling a cooling device that he was certain violated his patent. The device was manufactured by Dynatron in China and marketed hy Antec, a computer peripherals wholesaler in Fremont Calif

Corcoran enlisted the aid of Steve Driscoll, the attorney he'd worked with to secure the patent. to address the violation. Driscoll and I spoke last week, and his account of the case was fascinating. Driscoll said he sent

letters to Antec. Best Buy and Micro Center's parent company, Micro Electronics, that were "essentially ignored." He then filed a legal complaint, expecting that the case would he settled "for something less than \$100,000 and a reasonable royalty - 5% or so," But Antec and the retailers wouldn't even come to the table. Instead. they elected to bring their corporate might to hear in the courtroom.

At a time when corporate greed and arrogance are hurting so many people. one IT manager refused to be defeated by it.

If they expected Corcoran, Smith and Driscoll to cave, they miscalculated. "At this point, it wasn't ahout the money," Driscoll said. "We were not going to be intimidated by these guys."

The trial took place in the U.S. District Court of Eastern Pennsylvania in October 2007, and the case reads like a Hollywood screenplay. The arrogance of the defendants peaked when Otto Lee, a patent attorney and former mayor of Sunnyvale, Calif., testified for Antec. Sitting on the stand in this federal courtroom. Lee had the gall to refer to a "cease and desist" letter as an "eat s--and die" letter.

The lawyers for the defendants, meanwhile. threw up every roadblock they could, and money was clearly no object.

"It was insane," Driscoll said, "I couldn't helieve it when we found ourselves in court. Why were they spending all this money? It didn't seem to be a rational husiness decision." And then it came out.

Best Buy and Micro Electronics didn't care about

the money, because they were indemnified by Antec. And Antec didn't care, either. It was indemnified by Dynatron, the Chinese manufacturer. "That's how we all ended up there," Driscoll said. "It's a prohlem when you have somebody paying the hill who's not making the decisions." In the end, Corcoran

and Smith won the case - the jury returned a verdict of willful infringement. They'll receive a relatively modest sum for damages, prohably less than \$100,000. But just a couple of weeks ago, the court did something that's almost unheard of in a patent case: It awarded attorneys' fees. Dynatron is going to have to sell a lot of cooling devices to cover that tah, which is in excess of \$460,000. I'd love to convey the defendants' response, but neither Antec nor Micro Flectronics would speak with me, and Best Buy didn't even return my calls.

At a time when corporate greed and arrogance are hurting so many people, it's gratifying to see how an IT manager in Pennsylvania refused to be defeated by it. His lesson of perseverance is the hlockhuster we needed. Don Tonnant is Computerworld's senior editorat-large. Computers Can't Replace Service 'Magic'

Don Tennant's Editor's Note in the Jan. 26 edition ["Spirit of Service"] landed right in the bull's eye, I have been saying for years that places like Circuit City and CompUSA, which used to have very knowledgeable staff, are living in a dream world if they think they can compete without that knowledge base as part of their service model.

I remember back in the early 90s walking into a Circuit City not knowing anything about car audio systems. The manager of the department described everything I asked about clearly, with both knowledge and passion. You could see all over his face that he loved what he was doing and was excited to help someone new get started. Today, such service "magic" is largely gone; until it comes back, there is no market for the Circuit Citys and CompUSAs of the world.

A monkey can scan a product at a checkout stand. More to the point. a computer can manage the transaction. If that's all these businesses

have left, they are better off doing something else, because the consumer can get stuff cheaper online. Matt Goben, senior developer/ analyst, Burns & McDonnell, Kansas City, Mo.

Column on H-1B Visas Was Wrongheaded

premise in his Feb. 2 Editor's Note. "Better Than That." H-IB visa holders do replace American workers and do hold down American wages.

There are very significant numbers of foreign workers "legally" working in the U.S. for foreign companies without even having to have a visa. They are here "temporarily," paid their foreign salary plus a daily stipend for being away from family, housed in group apartments, and even supplied with cars to get to and from work. They typically stay for a year and go back to their homeland with a raise and promo-

a minutes to you florest

Microsoft Gives Vista Adoption One More Push

ICROSOFT CORP. last week made its best - and perhaps final - case as to why companies should consider upgrading to Windows Vista, even as successor Windows 7 looms on the horizon

Gayriella Schuster Microsoft's senior director of Windows client product management, said any customers still running Windows 2000 "should definitely move to Vista." And with Microsoft due to end mainstream support of Windows XP in April, she urged users of that operating system to consider "how much money am I spending keeping XP alive vs. moving on?"

Schuster, who also wrote

a post about upgrade issues on the "Windows for your Business" blog that Microsoft launched last week said users who skip Vista risk having their software vendors end support for the applications they're running on XP

In addition Schuster noted, most companies may take up to two years after Windows 7's release to deploy it because of all the required application testing and employee training. As a result, Vista holdouts could go five years or more between upgrades, she said.

Forrester Research Inc. surveyed 962 1T decisionmakers about their Vista plans last summer. In a re-

port issued in late January, Forrester said 30% of the respondents were already deploying Vista, while another 27% planned to roll it out this year or in 2010.

But the survey was conducted before the worsening of the economic downturn. Paul DeGroot, an analyst at Directions on Microsoft in Kirkland, Wash, said that in the current climate, Microsoft's reasons for upgrading may not be enough to get users to move to Vista.

For example, the Fulton County government in Georgia tested the beta of Vista three years ago and initially planned to upgrade all 6,000 of its PCs by the end of 2007. But even now, Vista is running on only a small portion of its systems because of budget cuts forced by reductions in tax revenues.

"We're stuck," said lay Terrell, the county's deputy director of IT. "We're going to wait for Windows 7. though it's not because we [want to] wait."

Papa Gino's Inc. looked at Vista for its 160 corporate employees but decided to wait for Windows 7, said CIO Paul Valle, And, he said, the Dedham, Mass.-based restaurant chain probably won't "get serious" about upgrading until Microsoft issues a second service-pack update for Windows 7.

- Eric Lai

AS PROMISED late last month, Microsoft Corp. last week shut off the Windows 7 beta spigot for users looking to test the software. Microsoft has not said when it will offer an upd build of Windows 7 to the public, although Steven Sinofsky, senior vice president in charge of the Windows engineering group said late last month that the software will move directly from the current beta version to release candidate

status. In the past, Microsoft has run through multiple public betas of its operating stems before shipping a release candidate, the last step in the testing process The company did note that subscribers to the TechNet and Microsoft Developer Network services can conlinue to access the Windows 7 beta. The beta is set to expire Aug. 1, after which users must upgrade to a newer version or reinstall an earlier Windows release.

Workers Losing Jobs at IBM Get Overseas Option

OME OF the workers being let go by
IBM in the U.S.
and Canada have
a chance to remain with the company —
if they're willing to move
to Brazil, India, China or
a dozen other lower-wage
countries. But the expatriate employees would likely
be paid at local salary rates.

IBM is offering the relocation option to employees who have been "notified of separation." It said that as part of the program, called Project Match, it will give workers financial aid to offset moving costs, assist them in securing visas and provide "other support to help ease the transition of an international move."

an international move."
But people who agree to
transfer must be "willing
to work on local terms and
conditions," IBM said.
The offer at least gives

workers affected by the job cuts a choice, said Robert Kennedy, a professor at the University of Michigan and author of The Services Shift. "What most of IBM's

competitors are doing is just eliminating jobs and hiring people in India," Kennedy said. "I would say from IBM's point of view, they're trying to meet people maybe not halfway, but a quarter of the way."

However, programs like Project Match will likely appeal primarily to young people who don't have families or mortgages tying them down, he said.

IBM spokesman Doug Shelton acknowledged that the program "is not for everybody." But, he said, it is "just one of many options available to IBMers whose jobs have been eliminated." Shelton previously de-

scribed the cutbacks as "an ongoing process that we do throughout the year to match skills and resources

with our client needs."

IBM hasn't disclosed the
number of employees being
let go. but Alliance@IBM,
a labor union trying to organize IBM workers, said
it has counted nearly 5,000

job cuts in recent weeks. Ron Hira, an assistant professor at Rochester Institute of Technology and co-author of Outsourcing America, said that Project Match "is a clear indication that IBM plans on accelerating its massive offshoring of U.S. and Canadian jobs."

Forensics Firm Finds Private Data on Drives Sold on eBay

A NEW YORK computer forensics firm said that 40 of 100 hard disk drives it recently purchased in bulk orders on eBay contained private information, including corporate financial data, DNS server information, and personal e-mail and photos. Kessler International said it purchased and evaluated the 4008 to 3000B PC drives from U.S. and Canadian sellers over a six-month period that ended late last month. "We were surprised with the

percentage of disks that we found data on," said Kessler CEO Michael Kessler. We expected most of the drives to be wiped — to hind one or two disks with data. But 40 drives out of 100 is a lot."

MICHAEL KESSLER,

Kessler's engineers had to use special forensics software to retrieve data from some of the hard drives. In other case however, sensitive information had not been overwritten or erased by the sellers. The researchers had expected to find personal information of individuals, "but we were surprised by all the corporate spreadsheets and business finance records we found," Kessler noted.

IDC analyst Charles Kolodgy suggested that users selling old PCs format their drives and use over write tools. Companies selling large disk drives on eBay should use industrial degaussers to erase all data, he added.

Intel Looks to Pull Itself Out of Economic Hole

Hit hard by the recession, the chip maker is pushing ahead with a \$7 billion conversion to a new manufacturing process.

By Patrick Thibodeau and Agam Shah

the same economic headwind that is buffering most IT vendors. The chip maker's fourth-quarter revenue and profits fell 23% and a whopping 90%, respectively. And last month, Intel said it planned to close four manufacturing facilities and

NTEL CORP. is facing

cut as many as 6,000 jobs.
Things aren't likely to get
better anytime soon. Intel
hasn't disclosed revenue
projections for the current
quarter, citing "economic
uncertainty and limited vis-

ibility." Meanwhile, market research firm IDC last week forecast that shipments of microprocessors will decline by about 15% this year.

cline by about 19% this year. But the economic woes aren't stopping Intel from moving forward with a plan to spend \$7 billion to refurbish three U.S. plants so they can produce chips using a new 32-nanometer manufacturing process. The planned investment, due to be made over the next two years, was detailed by Intel CEO Paul

Otellini during a speech in

Washington last Tuesday.

Later that day, Intel officials said at a press conference in San Francisco that the company will accelerate the shipment of its first chips with 32nm circuitry.

A pair of dual-core laptop and desktop processors built under the new manufacturing process are now scheduled to be released to PC makers in the fourth quarter. Those chips, code-named Westmere, will take the place of processors that were slated to be based on Intel's existing 45mm technology.

Jack Gold, an analyst at J.Gold Associates LLC, said the 32nm chips could give users a reason to upgrade their PCs, even if the economy is still in recession when the processors become available in systems.

Gold noted that for what will likely be about the same overall cost, users should get a substantial performance boost from the new chip technology, which Intel claims will result in faster, smaller and more energyefficient processors.

There are other good reasons for Intel to push ahead with its plan to build up the 32nm manufacturing capabilities despite current economic conditions and the steep price tag.

Forrester Research Inc. analyst Frank Gillett said Intel's road map for making the move to 32nm circuitry was set long ago. Not moving ahead with the plan could blunt the company's hard-earned technology edge over rival Advanced Micro Devices Inc. and exxose Intel to competitive

risks, Gillett said.

In addition, business spending on technology might be rebounding by the time the new chips appear in systems. "It would be hard to arrue that [Intel]

shouldn't be making this investment," Gillett said.

Shane Rau, an analyst at IDC, agreed that the shift to 32nm technology should help stimulate demand for Intel's chips, potentially enabling the company to increase its market-share lead

over AMD and other rivals.
Considering that IDC is predicting a decline in worldwide microprocessor shipments this year, gaining market share could be even more important to Intel from a business standpoint than it normally would be.

IDC said the drop-off began in the fourth quarter of 2008, with shipments falling 11.4% year over year and 17% from the third-quarter level. "After hinting at a decline last September, the market fell off a cliff in October and November," Rau said.

The plants that Intel will revamp for 32nm production are located in Oregon, Arizona and New Mexico. The company theoretically could have moved manufacturing of the new chips to a lower-wage country, and Otellini said foreign nations offered Innel hundreds of millions of dollars in financial incentives to do so.

But chip plants "are not driven by labor costs," Otellini said, adding that taking advantage of the existing U.S. facilities and their workforces will enable Intel to ramp up production of the chips more quickly.

"One of Intel's tremendous strengths is process control' in manufacturing, said Gartner Inc. analyst Leslie Fiering. And, she added, transferring those quality-assurance capabilities overseas would cost the company huge amounts of time and money.

Shah writes for the IDG News Service.

Netbooks Worm Their Way Into ISINESSES

Early adopters such as ADNH Compass are showing that some of the conventional wisdom about netbooks - that they're too fragile for on-the-go corporate users, too tiny for doing real work and too underpowered to run business applications - may not

be so wise after all. Of course, the conventional wisdom a year ago was that netbooks weren't for consumers, either, But 16 million were sold worldwide in 2008, according to ABI Research, which predicts that 39 million netbooks will be sold this year and that unit sales will

reach 139 million by 2013 Nethooks such as the Aspire One and Asustek Computer Inc.'s Eee PC typically have smaller screens and keyboards and use less powerful processors than conventional laptops and notebook PCs do. But they're also lighter and usually less expensive, with prices often starting at under \$400.

By a wide margin, netbooks have primarily been sold to home users thus far. But they can do anything a traditional work computer does - at least, from the perspective of Stan Jamrog. a network security instructor at Holyoke Community

College in Holyoke, Mass. Jamrog brings a Linuxbased Eee PC 1000 that he bought himself to HCC. connects it to the school's

HEN ADNH Compass, a 17,000-employee catering company based in Abu Dhabi. decided to give its branch managers new PCs late last year, it chose Acer Inc.'s Aspire One netbooks instead of full-size laptops.

The users who are not that computer-literate were excited that something like this was being given to them," said Graham Smith, ERP software manager at ADNH Compass. But it was Smith himself who pushed for the purchase of the lowcost, downsized Aspire One systems. "Both our operations managers and logistics operators are always on the move, so it makes sense to have something light and

portable," he explained. Now Smith is working to enable users of the 2.5lb. netbooks to access the company's Web-based SAP applications via 3G wireless connections. He said that

network and does his work on the netbook. "No one has scoffed yet," said Jamrog, who added that he and a full-time security professor at the college are thinking about pushing to require students to have netbooks.

Most PC vendors have avoided marketing netbooks to businesses, partly to avoid cannibalizing sales of higher-priced laptops, and partly out of fear that they might be laughed out of the offices of IT managers.

But after Hewlett-Packard Co. introduced its 2133 Mini-Note netbook for consumers and schools last year, "we' did get quite a bit of interest from the business sector," said Kyle Thornton, category manager for business

notebook PCs at HP.
In response, HP last
month launched the Mini
2140, a renamed secondgeneration system that includes a variety of features
developed with business
users in mind. For instance,
the high-end version of the
2140 comes with a six-cell
battery that HP claims can
last up to eight bours, or the
equivalent of a full business
day, on a sinee charge.

day, on a single charge. All of the 240 models, which start at \$499, sport a 10-in. screen with resolution of up to 1366 by 768 — the same as on a 32-in. 720p high-definition TV, according to Thornton. They also include an accelerometer designed to protect disk drives against data loss if a system is dropped, and HP says the machines' batteries can be

The only restriction from my IT manager is that I install the recommended antivirus software.

HP Sees Netbooks in Windows 7's Future

IN A VOTE of confidence for running Windows 7 on netbook PCs, Hewlett-Packard expects to offer three different editions of the upcoming operating system on its Mini

netbooks.
That includes the Professional and Home Premium editions, which Microsoft Corp. has said will be the two primary versions of Windows 7 – and the lowerd Starter edition, which will limit users to running

three applications at a time. Windows 7 is being built on the same code base as Windows Vista, prompting some fears that the new operating system may be too bulky to run well on the builty to run well on the plainty or well on the plainty even with Aero turned on; said Kyle Thornton, cat-gory manager for business.

recharged to 90% capacity

within 90 minutes. "We're

on visua and winques? In addition to the three editions of Windows 7, HP hopes to continue pre-installing both Windows XP Professional and Vista Business on its netbooks, Thornton said. The compar offers those two operating systems plus Novell Inc.'s

SUSE Enterprise Linux with the Mini 2440 netbook that it introduced last month.
But in a sign of the initial focus on home users at the netbook level, business-oriented versions of Windows on netbooks "are not being supported by Intel or Microsoft at all," Thornton

said. "We went out on a limb to put XP Pro and Vista Business on the 2140 and make sure it runs fine."

egory manager for business ; - ERIC LAI

whose battery life it claimed is up to 9.5 hours, although the system has yet to become available. Meanwhile, netbook market leader Acer is reportedly readying enterprise models of the Aspire One with larger screens and longer battery life.

MEETING BASIC NEEDS

But for end user Gabriele Indeiri, the original Eee PC TOI from Asus already fits the bill for the limited number of applications he needs to run as part of his job as an account manager at a U.S.-based software vendor.

U.S.-based sortware vendor.

"I'm usually at customers'
sites, and I have just a few
basic needs: read e-mail,
use Salesforce.com and be

able to show PowerPoints to customers, which I can do via my Eec's VGA port," said Indeiri, who asked that his employer not be named. A plus for the netbook is that it weighs only a shade over two pounds. "The [lack of] weight in my bag makes a difference." Indeiri said.

difference," Indein said.
Even some IT professionals, who often look askance
at new or nonstandard devices because of the security
and tech support complications they can create, are
relaxing that attitude in the
case of netbooks.

"The only restriction from my IT manager is that Iinstall the recommended antivirus software," said Benny Lo, a manager at a Hong Kong-based accounting firm that he asked not be named. Lo routinely uses his two Eee PCs on business trips or to work from home.

Malcolm Crabbe, a systems administrator at a restaurant supply company in London, said that the business replaced Dell Latitude laptops used by its 25 field engineers with Eee PC 901 systems three months ago.

Feedback from the users "has been very positive," said Crabbe, who also asked that his company not be identified. The netbooks, he noted, are "light enough to be held in one hand [and] compact enough to fit under the seats" in the vans used by field engineers — an attribute that he said helps prevent thefits.

But, Crabbe noted, the systems are also powerful enough to be used in reprogramming faulty customer equipment. The use of the netbooks is saving money and helping to speed up equipment repairs, he said, adding that the company hopes to get "two or three years from each Eec."

SQL Server

As I function in the same industry [white] IT leaders function in, my access, my exposure, my opportunities are greatly limited simply because I am an African-American.

Continued from page 12 replace or to supplement them.

To some degree, that's the result of inscurrily risk position. In my early years, I was vice president of a financial services firm, responsible for himing technical people, and I hired hased upon ability. As it turned out, I probably hired an equal number of African-Americans and whites. I was at a meeting, and one of the hoard members of you attempting to make the orchitals at aff. at or company the United Nations? T could have been intimistated by that. My response was, "I hire based upon need and capability, not on what

I see." And that director walked away.
That wasn't subtle at all. But there
are more subtle ways in which people
who have moved to a higher position
can [be made to] feel less secure. Not
everyone in that position has a desire
to push hack. If they're going to be critcitized for it, they're less likely to do so.

What is your response to a white person who suph selective that of you as a black IT leader, he just worst to think of you as a black IT leader, he just worst to think of you as an IT leader - that he worst to be contribin? My response to him would be that is a very altruistic look at the racical slooks we are not there. It is a goal that we all want to achieve, but if he just looks at me as an IT leader, then his expectation of what I am all he to do is surrealized.

The reality is that as I function in the same industry that the majority [white] IT leaders function in, my access, my exposure, my opportunities are greatly limited simply because I am an African-American.

I have had husiness opportunities where I have spoken with a prospect by telephone, and we have in essence where I have this it has eachier to the wread they this it has eachier to the

I have had husiness opportunities where I have spoken with a prospect by telephone, and we have in essence agreed that this is the solution that would be best for that person's company, and all we had to do was sign the agreement. And when I showed up to do the project. What to the reason is compared to the person has changed his mind about wanting to do the project. What to ther reason could there he? And it's happened to me several times.

Does it still happen? Oh, yeah. It still happens. So there are still some things that need to be done.

What is your response to black IT professionals who say they just want to be thought of as IT professionals, not as black IT professionals? That they are operating under a delusion.

On the one hand, you're saying that racism is as much of a problem as it ever was. and on the other, you've said that your son has fewer scars because of the more alticultural environment. How do you explain that apparent inconsistency? My son grew up and lives in an environment that is different from that of quite a few, and maybe even the majority, of African-American youth his age. My son grew up in Howard County, Md., a stone's throw from [the affluent community of Columbia. He went to a high school that was a mixture of everybody. So his interaction with other students was not hased upon separation and segregation. His friends are white, Hawaiian, African, African-American everything. Perhaps if he went to

school in the District of Columbia, his experience might be very different.

What does the election of Barack Obama say about the state of race relations in the U.S., and what would you say to someon who maintains that the election demon strates that we can finally move past the race discussion? The election of Barack Ohama tells me that we have overcome a significant impediment in the United States, that there was enough openness or need on hehalf of the voters that they could look past skin color to what the potential was of the candidate. I hope that he is not being looked at as a Moses who is going to save everybody. so that people become complacent and figure that we've overcome these problems and now the racial divide has heen crossed

He is an agent of change who can inspire people. But unless we now double or triple our efforts to effect those changes, we will be deluding ourselves.

What has in bagoes for there is no looped to a need for a searchistor of block IT professionals? Parity, During the '05, and '70s, in the civil rights exa, it was said that along with your civil rights. Economic benefit gives you the power and ability to effect change. My contention — and maybe it's why Tim in business — is that if there is a foundation of businesspecified and business entitles mortised in the company of t

What I would like to emphasize, though probably more than anything else, is that professional organizations are very, very necessary, particularly for African-Americans and other minorities. The necessity doubles when you get into exconomic circumstances like what we're in now. A professional organization gives you an opportunity to develop skills that you'll need in your workplace, but it does that in an environment that is supportive, as opposed to combative.

Now, with things economically going south, the network you develop will help you survive these downturns hetter than if you were out there doing it by yourself.

- Interview by Don Tennant

Ira Winkler

Where Are the Feds On Cybersecurity?

COUPLE OF RECENT EVENTS have shown how purposefully useless the U.S. government is with regard to cybersecurity. Every so often, the FBI parades some success stories through the media. Unfortunately, what's behind them are prosecutions for show rather than true demonstrations of tackling cybercrime.

For example, U.S. law enforcement had nothing to do with the takedown of McColo, the ISP that was home to major botnet controllers. It's telling that foreign criminal gangs felt comfortable enough to use a U.S.-based service to host their critical servers.

Despite the fact that the crimes enabled by McColo included child pornography, cyberextortion, distribution of malware, identity theft - really, just about every cybercriminal act known to law enforcement - the FBI had nothing to do with taking down the hosting service or making any arrests of those profiting from criminal behavior. It was up to independent malware researchers to identify McColo and work with upstream ISPs to cut it off from the Inter-

net. That is despicable.

Before the takedown of McColo, I received more than 300 spams a day. After McColo was taken off the Internet, my spam vol-

ume was down to 50 per day. Now, a few days into the spread of the Downadup worm, my spam volume is up to 200 per day.

Judging from my analysis of the new spams I'm receiving, it is clear that this is the work of the same malware purveyors who previously used McColo. Depending on whose statistics you use, Downadup has infected anywhere from 6% to 30% of the PCs on the Internet.

And this time around, it is once again independent researchers who are trying to stem the growth of the new botnets by reverseengineering the malware

■ Even though the crimes included just about every cybercriminal act known to law enforcement, the FBI had nothing to do with taking McColo down. ckling cybercrime.

and determining the potential domains the infected systems will try to connect

to. At their own expense, the researchers are registering hundreds of domains to try to disconnect infected systems from the botnets.

To take a step back and explain the situation as simply as possible, once malware infects a system, it seeks out a controller. The controllers are referred to

by Internet domain names. With Downadup, because the malware writers knew that the domain names would be taken down as they were discovered, they programmed their algorithms to search

for thousands of domains. By reverse-engineering the malware, the researchers determined as many potential domains as possible and attempted to register them away from the botnet controllers. This is very timeintensive and expensive for independent Samaritans. Again, the U.S. government is nowhere to

be found in the process. Given the fact that millions of computers are being amassed for clearly criminal, and potentially terrorist, acts, the Department of Homeland Security, the FBI or some other agency should be taking the lead in this. Given past experience, these botnets will likely be the source of billions of dollars of criminal acts.

dollars of criminal acts.
Clearly, the government
has the resources to track
the botnets and register
the criminal domains. But
because it hasn't acted, we
instead have a random,
distributed and poortly
funded effort being performed by good Samaritans at their own excense.

One naive person suggested that the FBI is keeping the criminal systems running so it can infiltrate the criminal gangs. While there are some cases of that, the scope of the Mc-Colo and current malwarerelated crimes is astronomical. A hospital system crashed as a result of the malware infections. It would be gross negligence for the FBI to allow the attacks to continue if it had the ability to stop them.

until the U.S. government decides to stop turning a blind eye to blatant crimes, cybercrime prevention and enforcement will remain a joke. In Iran Winkler is president of Internet Security Advisors Group and author of the book Spies Among Us. He can be contacted through his Web site, www.irawinkler.com.

A TWIST OF FATE HAS TECHNOLOGY VETS AND FRESH TALENT VYING FOR THE SAME JOBS.

HIN MILL HONNE sammed into an even-ining meet-and-greet bring held by a local packaging company in search of fresh Til talent, the critical companer can be compared to the co

Verizon in 2002. Six years later, Horne says he knew that the IT field had changed dramatically, rendering him "out of step" with cutting-edge IT.

But after watching his retirement savings dwindle and the degrand for small citids with

But after watching his retirement savings dwindle and the demand for small side projects disappear, Horne says he was "economically motivated" to re-enter the workforce. A casual meetand-greet seemed like a perfect opportunity for the baby boomer to get his feet wet.

Horne was in for a shock, however. Expecting an informal recruiting event, he found himself in the thick of what "felt like a discotheque," surrounded by throngs of aggressive twentysomethings jostling for the attention of senior-level managers and barking into their cell phones.

"They were talking a lot, the noise was deafening, and the atmosphere was loud, confused and not very businesslike." Horne recalls.

His experience is far from unique. Throughout busy job fairs, crowded boardrooms and hectic IT departments across the U.S., a battle royal is brewing between aging baby boomers and fresh-faced millennials — two distinct generations with differing work styles, conflicting cultures and disparate

Y CINDY
WAXER

Skill sets.

On the one side stand the boomers: IT veterans valued for their unwavering work ethic, vast experience and institutional memory. On the opposing side, the millennists: Web 2.0 natives with technology in

their DNA who would rather text and Twitter than talk and who have little patience with the way things have always been done.

IT managers are facing a tough predicament: a head-on collision between two vastly talented yet differing generations, both vying for full-time employment in a fast-shrinking economy. And it's happening everywhere. Baby boomers coming back into the market is very common," says Brooke Kline, chief technology officer at iBank, a Costa Mesa, Calif.-based money management firm. "At the same time, we have just as many millennials coming out of college looking to ex-

plore new opportunities." Deciding whom to hire - or lay off - requires sorting through a minefield of competing technical expertise, business acumen, cultural preferences and career expectations.

NEW RULES

Baby boomers and millennials might have eased by each other in the workplace with no clash at all, as boomers gradually retired and millennials moved in and up the ranks. But a faltering economy changed all that. Over the past 15 months, the stock market has wiped out \$2 trillion in Americans' retirement savings, according to the Congressional Budget Office. And even before the financial crisis hit full force, a February 2008 survey by job site

Care erBuilder.com revealed that nearly three out of five U.S. workers age 50 or older were planning to look for work elsewhere after retiring from their current jobs. And that can put them into competition

with candidates their children's ages, says Horne, because once an employee retires, he loses his seniority, "I have realistic expecta-

tions that I'm not going to be appointed vice president," he says As boomers struggle to resuscitate their careers and millennials flood the workforce, IT managers are having

to rethink what it means to be an IT professional and to weigh the relative value of traditional and new-age skills. That's not always easy. For example, millennials have a tendency to eat, sleep and breathe Web 2.0 technologies, and the value of that may not be

boomers coming back into the market is very common. BROOKE KI INF. CTO IBANK

immediately clear to a hiring manager. "When my boomer colleagues see me texting, blogging and using wikis, they see it as social" as opposed to work-related, says Brett Gardner Bonner, a 26-year-old engineering specialist at FedEx Corp. But they're just tools I use to achieve higher re-

sults by gaining consen-

sus and connecting with others." Yet it's precisely these tools - and users' proficiency levels - that are dividing the generations into warring factions. "A millennial is more likely to communicate electronically or be more involved in social networking," says Sherry Aaholm, FedEx's vice president of IT. Take, for example, Bonner, who practically showers with his BlackBerry Storm and claims his familiarity with Web 2.0 tools is "almost innate." He says he regularly relies on wikis, Twitter and microblogging services like Yammer to communicate with colleagues and swap information. "Boomers prefer conference calls and e-mails, whereas I prefer texting and

wikis," says Bonner, But it's not just the Web. "There's a lot of new technology - like agile software development and open source → that young kids have picked up, whereas some of the older folks are still working on migrating," says Jeff Schuster, a recruiter at IT consulting company Halo Group LLC in Novi, Mich. Boomers are better known for their expertise in more traditional technologies such as IT infrastructure and operating systems. That's good news for FedEx, which is always on the lookout for IT professionals with the skills needed to support its largely mainframe-based package-tracking system. But that type of expertise can limit boomers' prospects elsewhere,

Schuster says. And it's not just about skills; attitude also plays a major role in who gets hired. For example, millennials' eagerness to adopt new technologies - and some boomers' tendency to resist doing so - may make recruiters think twice before bringing on an older candidate

Continued from page 18 in need of extensive training. "The boomer folks are a little more fixed in their ways and not as open to learning a new set of technology skills," says Aaholm. "That's the difference with the millennial generation — they're willing to expand their skill base."

This eagerness to learn is giving many millennials a leg up on the competition. But there's a managerial flip side to consider. Young IT workers who are bold enough to take on new technologies are also more likely to be impatient with the constraints of traditional workolaces.

"There's an expectation on the part of millennials that the people who are managing them won't just see them as

cogs in the machine but will be flexible with them and take their preferences into account," says Tom Clement, 54, an IT manager at application development firm Serena Software Inc. in Redwood City, Calif.

That kind of rugged individualism delivers enormous value to pioneering companies such as Serena, which is adopting innovative development trends, such as "business mashups" or composite applications, to stavabled of the curren

stay ahead of the curve.
"It takes guts to build mashups, and that's what is great about the millennials," says Clement.
"They've got the guts
to go in and create
a new application,
whereas [boomers]

aren't as emboldened."
Businesses that
expect all employees
to march to the beat
of the same drummer,
however, may have
a tough time reining
in millennials' more
spirited work ethic and
thirst for experimentation. And millennials'
tendency to mix work
with pleasure is an-

other factor that could influence the hiring decisions of IT managers. "Millennials really want a work-life

balance that's seamless; they want to be able to communicate with their friends while they're working," says Kline. The older generation, in contrast, wants "to be productive from 8 am. to 5 p.m. and focus only on work." Those tendencies recently convinced Kline to hire a boomer — not a millennial — for a help desk maintenance job with the steady hours of 7,30 a.m. to 430 p.m.

"When we looked at the strengths and weaknesses of the candidates, we felt that a baby boomer was more equipped to handle that type of position," says Kline.

Cherry-picking aside, companies

must still make some cultural adjustments to successfully mix millennials and boomers in the workplace. Your company's willingness to make those adjustments will affect its ability to recruit and retain talent.

"From a baby boomer's standpoint, it's a big change to see a really bright guy come in at 10:30 a.m. wearing shorts and sneakers and start work," says Kline. "Breaking down that barier is a big challenge."

Just ask Horne, who dedicated his entire career to a single employ-

er. "Kids coming out of school have no work ethic," he says. "They think life is a video game and that you get paid because you show up."

John Martin, a 62-year-old iBank quality assurance specialist, is more tactful. "My approach to working is much different than that of today's millennials," he says. "A great number of them think there are unlimited jobs out there, and so they approach work a little more casually than people of my generation."

DEFINING 'PROFESSIONAL'

It's this perception among boomers that deeply offends Nathan Williams, a 30-year-old Screna software engineer who identifies with the millennial genation. "There's the misconception that we're just not professional. But the truth is, we have different ideas of what it means to be professional, and a casual attitude is part of that."

In fact, Williams says millennials' easygoing disposition encourages creativity and "a willingness to break boundaries" that contributes to tasks such as product development.

such as product development.
Millennials' casual approach to work
can back fire in risky ways that managers also need to consider, however.
According to a February 2008 study by
security systems provider Symanete
Corp., when asked whether they feel
entitled to use whatever application,
device or technology they like, regardless of source or corporate IT policies,
60% of millennials said yes while only
31% of other workers did.

Millennish and boomers may have to agree to disagree show that in means to be an IT professional today. But for the professional today but the professional today but the professional today but managers more and professional today to quickly. The pressure on fron-line managers nowadays with the millennials compilg not be wedforce is greater than it's ever been. "says Liss Dryell, a generational relations expert and author of Millennish Rocoprouted (Wysta-MacKenia, 2008).

And, she warns, "the competition is only going to get more fierce as time goes on."

Grand Rounds Grand Scale

Audiovisual technology fosters better collaboration among doctors and a new way of teaching medicine. **By Mary K. Pratt**

OCTORS HAVE long had a tradition of holding "grand rounds" to discuss patient cases and educate aspiring physicians.

cate aspiring physicians. The centuries-old practice certainly has its merits, but medical leaders in Arizona want to improve, update and broaden it to include a larger list of health care practitioners, such as nurses and social workers, regardless of their locations.

So the Arizona Telemedicine Program (ATP) drew on its extensive use of videoconferencing equipment to develop the Institute for Advanced Telemedicine and Telehealth, or the T-Health Institute, to facilitate a 21stcentury way of teaching and collaborating across disciplines and professions.

This novel approach and use of technology put the T-Health Institute at the top of the Education & Academia category of the Computerworld Honors Program.

"Its specific mission is to use technology to permit interdisciplinary team training," explains Dr. Ronald Weinstein, co-founder and director of the ATP. "Now we're opening it up to a far broader range of partici-

pants and patients."

This initiative goes well beyond simply connecting

two doctors through videoconferencing. It also enables individuals to meet in person in the newly built T-Health amphitheater.

T-Health amphitheater.
They can also meet remotely through finely tuned audiovisual equipment that can seamlessly segregate both in-person and remote meeting participants into smaller discussion groups.

TEAMS IN TRAINING

Project leaders say the goal is to create much-needed discussion and collaboration among professionals in multiple health care disciplines so that they can deliver the best care to patients.

"It's the effort to be in-

The T-Health amphitheater lets on-premises and remote next lets on the second sec

clusive," Weinstein says.
"Medicine is quite closed
and quite limited, but we're
counting on telecommunications to bridge some of
those communication gaps."

He's not the only one preaching this message. The prestigious National Academy of Science's Institute of Medicine (IOM) has advocated for more interprofessional training and has encouraged educators to develop more interdisciplinary curricula and incorporate interprofessional team training into their programs.

In a 2003 report, the IOM stated that "although the academic environments of the various health professions generally are not interdisciplinary, practice environments are increasingly so, posing a serious disconnect."

One of the report's recommendations called for "developing and funding of regional demonstration learning centers, represening partnerships between practice and education."

Weinstein sees the T-Health Institute as one of the first such centers

The institute is essentially a teleconferencing hub that enables students, professors and working professionals to participate in live meetings. Its technology also allows them to switch nearly instantly between different discussion groups as easily as they could if they

Continued from page 22 were meeting in person and merely switching chairs.

Today, the facility has two panels of four screens (there are plans to add more). Two of the eight screens are focused on the two so-called hot seats in the auditorium. and the remaining screens are reserved for participants calling in from other sites.

Those participants might be calling from sites already in the ATP network or they might be invited from outside the network as guests.

Attendees can participate in a single large meeting. or they can be broken into groups - one group of screens would be bordered by blue and the other by red to distinguish between the two meetings. Participants can be switched between the groups to shake up dis-

cussions. This unique, flexible, agile setup directly supports the goal of providing interprofessional education. For example, participants in a meeting that involved medical students as well as nursing and pharmacy students could interact in various combinations so they could learn to work together and see the benefits of providing health care in a coordinated and collaborative manner. Weinstein explains.

"You just open up the world in terms of educational activity, research, case conferences," says Gail Barker director of the T-Health Institute. "It breaks open any barriers to interprofessional education."

A NEW WAY TO TEACH The T-Health Institute is a division of the ATP, which Arizona lawmakers estab-

lished in 1996 as a semiautonomous entity. The ATP operates the Arizona

T-Health Institute

nstitute for Advance nedicine and Teleh m as the T-Health e, manages and pro-

s. The inst d\$2.1 mi on in stat deral funding.

Telemedicine Network, a statewide broadband health care telecommunications network that links 55 independent health care organizations in 71 communities.

Through this network, telemedicine services are provided in 60 subspecialties, including internal medicine, surgery, psychiatry, radiology and pathology, by dozens of service providers. More than 600,000 patients have received services over the network

Meanwhile, in 2004, as the IOM was pointing to communication gaps among health care professionals as a cause of significant problems, Arizona officials decided to create a new Phoenix branch for the state's medical school, the University of Arizona College of Medicine, in partnership with Arizona State University.

As part of that project, state leaders decided to build on the ATP's successes, and they identified the telemedicine program as an enabling technology for the educational program.

PROJECT RETURN: Proj leaders say the initiative nts and working als learn how to

"We were selected by top leadership to think about how technology could make a difference" Weinstein says.

ATP leaders saw videoconferencing as a way to draw together students and professionals from the different health care disciplines in new ways

It's literally a new method of teaching medical students. It's a novel approach," says Jim Mauger, director of engineering at Audio Video Resources Inc., a Phoenixbased company hired to design and install the videoconferencing equipment for the T-Health Institute.

The T-Health Institute is on the campus of Arizona's new medical school in Phoenix. When it opened in 2006, every classroom on the campus was equipped with videoconferencing capabilities that tied back into a central control room, Mauger says, At that time, the T-Health amphitbeater contained a standard teleconferencing setup, he explains. From that base, Mauger

the wall. says project leaders immedi-

ately started implementing the sophisticated technolo-

gies that are present today. Because the ATP already had a statewide broadband health care telecommunications network in place, those implementing the infrastructure for the T-Health Institute could focus on getting the audio and video equipment needed for the job, says Michael Holcomb. the ATP's associate director for network architecture.

BROADCAST BOOTH

The T-Health Institute uses a Tandberg 1500 videoconferencing system, and its video wall has 12 50-in. Toshiba P503DL DLP Datawall RPU Video Cubes. The video wall itself is controlled by a Jupiter Fusion 960 Display Wall Processor utilizing dual Intel Xeon processors. The Fusion 960 allows the wall to display fully movable and scalable images from multiple PC. video and network sources.

A dedicated control room holds the audio and video switching equipment and Tandberg coder/decoders to connect the amphitheater to other telemedicine locations. The T-Health Institute's equipment is compatible with all standards-based equipment at other videoconferencing sites, Mauger says,

The amphitheater has 17 student desks with individual videocameras, microphones and headphones. There's also a free-standing Wharton Lectern with a Crestron control panel. which facilitators can use to control how participants are grouped on the video wall. Personal voice channels are clustered based on how the participants are grouped on

Although Weinstein was

able to articulate this vision of interprofessional interaction - that is, he could clearly lay out the user requirements - implementing the technology to support it brought challenges, IT workers say.

Mauger says creating a videoconferencing system that linked multiple sites in one video wall wasn't the challenging part. The real challenge was developing the technology that allows facilitators to move participants into separate virtual groups and then seamlessly

switch them around. "The biggest challenges to making this work were the audio isolation among the separate conference participants as well as fast dvnamics of switching video and moving participants to meetings," he explains.

To address those issues. Mauger says he customized the control system, a set of hardware and software tools from Crestron Flectronics Inc. He also customized hardware from Extron Electronics, a maker of professional audiovisual systems integration products.

Mauger uses MediaMatrix from Peavey Electronics Corp. for audio processing.

"All this work took a couple of iterations, and we're still fine-tuning it," says Leela Doppalapudi, an ATP senior systems programmer and project manager

for Phase 2 of the T-Health initiative

Project leaders credited the team for having the

expertise to get those components online. "It took all of our experience in videoconferencing to bring it all together and make it work." says Holcomb. He says his team also en-

countered other challenges - ones that affect more typical IT projects, such as budget constraints, the need to get staffers in different cities to collaborate and the task of translating user requirements into actionable items. He notes that naming Dop-

Health at the University of Arizona and is a user of the system, led a trial-run training session at the T-Health amphitheater. She met with 13 people, including a clinical pharmacist, two family nurse practitioners, a senior palapudi as project manager business developer, two in 2007 was instrumental in program coordinators, a diaovercoming those challenges betes program case manager and an A/V telemedicine

and getting the job done.

"It's necessary to have

who is not just meeting with

people every now and then.

with them on a daily basis."

someone there on-site who

specialist

For that event, Barker says the biggest benefit was the time saved by having the facility in place; without the T-Health Institute, some participants would have had to make a four-hour round trip to attend in person.

Feedback from participants was positive, and there were no technical glitches during that first real test, Doppalapudi says.

Now the system is open ing up to others in Arizona's health care and medical education communities T-Health Institute officials say they see this as the first step toward a health care system that truly teaches its practitioners to work together across professional disciplines so that they can deliver the best, most efficient care possible.

"We think," Weinstein says, "that this is the only way you're going to create coordinated health care." Pratt is a Computerworld contributing writer in Waltham, Mass, Contact her at marykpratt@verizon.net.

Get More From Videoconferencina

AIL BARKER HAS noticed that participants who don't speak up during in-person meetings often harroma much more active in discussions held via videoconferencina.

Perhaps it's because they feel less intimidated when they're not physically surrounded by others or because the videoconferencing screen provides a buffer against criticism, says Barker, who is director of the T-Health Institute and a teacher at the University of Arizona's College of Public Health

"Some people just seem more comfortable. That's our hypothesis, and we're testing it," she says.

When used poorly, videoconferencing can be stiff and dull, just a talking head beaming out across cyberspace without any chance to engage the audience. But Barker and others are finding that when the technology is used in a thoughtful and deliberate manner, it has some advantages over real-life sessions because of its ability to draw more participants into the fray. Of course, not all organizations

can build something as complex as the T-Health Institute's system. But your IT unit can deploy other. smaller technologies to help encourage more robust participation from those using videoconferencing. Consider using the following tools and techniques:

1. Two-way video. A speaker who can't see his audience members won't know when they're not engaged, even if there's an audio link. But with two-way video, the speaker could see when boredom is setting in and adjust the presentation accordingly, says Wendy Wallbridge. president and executive coach at On Your Mark Corporate Coaching & Consulting Inc.

2. Proper camera position, Leels Doppalamedi, an ATP senior systems programmer and T-Health Phase 2 project manager, says his team experimented with camera placement to ensure that participants would have a

natural-feeling visual connection. 3. Seamless controls. Doppalaoudi says his team also kept things simple, automating whatever they could, so users wouldn't be distracted by controls.

4. Alternative comm cation channels. Attendess at one of Wallbridge's webinars used text chat to communicate with her individually. The option allowed one participant to feel comfortable enough to ask a question that she seemed reluctant to ask in front of the others. Wallbridge says the question allowed her to tailor the discussion to answer the question and engage that participant. 5. Application sharing technology. This allows attend

ees to focus on the discussion yet still capture and share information, Wallbridge says.

Why Good Leaders Make Bad Decisions

... and what you can do about it.

Why do good lenders sometimes make spectacularly bud decisions? In this month's Harvard Business Review, Andrew Campbell und coauthors to Whitehead und Sydney Finkelstein discuss what they learned by examining 83 fluwed decisions. Campbell, a director of the Ashridge Strategic Management Centre in London, talked with Kuthleen Melymuku ubout how to recognize the dunger signs and head off a bud call.

You write about two hardwired processes for decisionmaking. The first is pattern recognition. How does it work - and sometimes mislead us?

and sometimes mislead us? Pattern recognition is just a process, like recogniting a face. What's incressing is that it's not like flicking through a photo album till you find the right match; it's more complicated in that the brain perceives many different bits of information from an event that it assembles in a rottern euided by perceives patterns assembled in the brain. In IT, for example, if an exec is trying to resolve some problem and faulty software was to blame previously, he will see that as the problem if any of those symptoms are around. There is fikely to be a bias.

The second process is emotional tagging, flow does that work and sometimes mislead decision-makers? Experiences and thoughts are tagged in your memory alongside the emotions that accompany them. If you had a very good experience with a new ERP project, then you will have a strong emotional tag

toward ERP

You also note a lack of checks and balances in our decisionmaking. Yes. We may think that a system is not working because of poor documentation, but we don't really know why we think that. A lot of it has happened in our subconscious. Also we make decisions one plan at a time. We assess the situation and conclude that the problem is lack of documentation and we should improve the documentation process. Then we run a little movie in our heads imagining what will happen when we implement that judgment. If our imagination can't find any fault, then we've made the decision and frequently don't seriously consider other options. But if we see a problem with

that solution [later], then we say, "How else can I solve this documentation problem?" not "Is this really a documentation problem?" We take for granted our initial assessment.

You've identified three "red flag" conditions - self-interest, distorting attachments and misleading memories - that lead to bias, and you suggest safeguards to head off had calls. Let's try this out in the case of a project sponsor trying to decide whether to kill a faltering project. Let's assume this person championed the project six months ago. So immediately. you've got distorting attachment, potential self-interest because the person might get egg on his face if the

Flags

Self-interest influences people's judgments even when they are self-aware and trying to be objective. Distorting attachments cause positive or negative biss. An Wang's flawed decidion to use a proprior of the people of the peo

Misleading memories of a bad or good experience can impair your ability to make a balanced decision in that area in the future. project were canceled, and you've also got potentially misleading memories because he will have decided the project was a good idea when he champioued it. Those indements are still stitting around in his brain, and it's difficult to dislodge them with new judgments even though there is new information.

Given that the bias would be toward continuing, the process I would suggest here is to let the project manager do the analysis and make the call. If he says kill it, no extra process is needed, since his bias was for keeping it going. If the project manager says they should give the project another shot, then I'd add some process here - bring in others for additional debate and challenge, or have the people above this person second-guess that choice because there is a risk that his thinking is biased.

So you don't need a standard decision process in place; you just need to be aware of bias and kick in the process if the decision lines up with the bias? Exactly. Instead of cluttering things up with claborate decision processes, you can say, "You make the call. If you call 'Kill it,' end of process. If you call 'Kill it,' end of process. If you call 'Stap with it,' we need more process because we recognize you because we recognize you.

might be biased."
The exciting thing about this is that we can put on the table a lot of things that are normally under the table."
I hear what you're saying, but do you think you thinking might be distorted because of such and such?" And also, we can make up the process to suit the decision challenge rather than have all this bureaucray and

process.

Why Good Leaders Make Bad Decisions

... and what you can do about it.

Why do good leaders sometimes make spectacularly bad decisions? In this month's Harvard Business Review. Andrew Campbell and coauthors Jo Whitehead and Sydney Finkelstein discuss what they learned by examining 83 flawed decisions. Campbell, a director of the Ashridge Strategic Management Centre in London, talked with Kathleen Melymuka about how to recognize the danger signs and head off a bad call.

Performance to go

Bullish On **PaaS**

Developers say 'platform as a service' is fast and elegant. By Mark Everett Hall

LATFORM AS a service, or PaaS, is the cousin of the better-known "software as a service." SaaS delivers a fully baked application you can subscribe to and use immediately; with PaaS, developers use free programming tools offered by the service provider to create applications and deploy them in the cloud. The infrastructure is offered by the PaaS provider or its partners, which charge by some usage metric such as CPU use or page views. This development model

is radically different from traditional approaches. where programmers install commercial or open-source tools on their local systems. write code, then deploy and manage the applications on their own infrastructures. But the PaaS model is rapidly gaining adherents.

Garrett Davis spent more than 30 years writing software for big insurance companies. But when he struck out on his own as an independent developer. he wanted to "get in on the ground floor of the new environment"

He turned to Google App Engine to build his work in the PaaS cloud. He says that "after many years of writing zillions of lines of Basic. then Cobol, then 12EE," App Engine's tools, especially the elegant Python, had great appeal, "The Python language doesn't force me to clutter up my code with curly braces and semicolons," Davis says.

FASTER DEVELOPMENT Developers can be extremely productive with PaaS, in part because they don't need to worry about defining scalability requirements, nor do they have to write deployment descriptions in XMI, which are all handled

by the PaaS provider. Davis quickly produced payroll and property management applications. With App-Engine, he says, he needed only one month to reverseengineer a workers' compensation application from one written over a period of 50 staff-months in 12EE.

Michael Iovino, CIO at Author Solutions Inc. in Bloomington, Ind., is also impressed with the time-tomarket advantages of PaaS. Eight of his programmers

built the company's iUniverse authoring application with Salesforce.com Inc.'s Force.com PaaS development environment. In only three months, the team delivered a full-fledged program with a complete set of business logic and multifaceted options that assist book authors with everything from text layout to marketing and distribution. "I'm pretty happy with the speed of development," Iovino says. Ray Chance, executive di-

rector of ECMInstitute LLC in Fredricksburg, Va., points to another big draw for PaaS: low cost. His nonprofit group is a hub for the distribution of information about enterprise content management. It uses a custom RSS service built with Google App Engine to get the information out to the institute's L000 members. Chance says that as long

as you have fewer than 5 million page views per month and need less than 500MB of online storage, the Google service is free. More important, Chance says, is that his App Engine-built RSS application is deployed and maintained in Google's data center, which Davis describes as "the most sophisticated collection of silicon and storage on the planet."

But there are drawbacks to building PaaS software, For example, Chance says App Engine's Python can sometimes be a "struggle" because of its memory management limitations. And caching issues can limit how quickly RSS feeds can be fed from his site. Davis also says organizations might find it difficult to port J2EE apps to Google's restricted environment.

The Force.com environment is fairly robust, says Iovino. And additional development tools are available from Salesforce.com's AppExchange third-party software market. He adds that Force.com will need better code-management capabilities if the PaaS model is going to succeed in the long term, however.

Iovino also notes that because code executes in the Salesforce.com multitenant infrastructure, developers have to be cognizant of limitations. For example, they need to break up a long service call or data request into smaller, more manageable pieces. Iovino says developers quickly incorporate that notion into their thinking. Mike West, an analyst at Saugatuck Technology

Inc., says research indicates that PaaS, while in the early adopter phase, is attracting developers from businesses of all sizes because of its ROL

"An increasing percentage of application development dollars are moving to PaaS," he says.

Another Delay, Another Black Eve for Security

Projects are supposed to get security reviews at every phase of the project cycle. When that doesn't happen, you get delays.

HIS WEEK, I ran into unexpected trouble. A project is ready to go live, but it never received a security review. And it has a lot of the elements that would go into a worst-case scenario: a third party, sensitive data, the Internet and no plans for encryption.

We've done a good job of getting security reviews into all phases of our proiect cycle, including the concept stage. That means we've been able to avoid most last-minute security roadblocks. So, how did this one fall through the

Maybe because it's a third-party application that's accessed over the Internet via software on end-user systems. People tend to think of that sort of implementation as a handsoff situation. Of course. most people don't think

like a security manager. When I look at what's planned with this implementation. I see data - in fact, employee payroll information - being sent to a third party. I see a looming nightmare, since the company that hosts the financial application in question seems to have no understanding of, or ability to provide, encryption. As soon as I heard about this (secondhand), I asked for a meeting with the project manager, I couldn't believe what I was hearing. Employee names, Social Security numbers and pay amounts were going to be transmitted over the Internet, with no encryption. I told the project manager that we'd need a minimum of file-level encryption, preferably at the point where the data is created (in this case, in PeopleSoft), And I added that it should not be decrypted until it is used. ideally within the thirdparty application itself. I'm willing to compromise on exactly where the data is encrypted within our perimeter, but once it gets out to the Internet, it needs to be protected, in an un-

readable form. I wasn't saving anything new. Last year, we forced file encryption on many projects that involved

■ Last year, we forced file encryption on many proj ects that involved third parties.

Trouble Ticket

AT ISSUE: A project is about to go live, and it has

ACTION PLAN: J take a look, and der

challenging, our end users are expected to export data from PeopleSoft into a file on their desktops and use the third-party software client to import that data directly into the application. Educating our end users, who are not technically inclined, on the use of PGP or something similar will be an uphill climb. But so will getting the vendor to build encryption capability into its service offering. By the way, after a little

digging. I discovered that this vendor doesn't seem to have any large clients. so we get to be the guinea pig. I'm sure that once it establishes encryption capability, its application will be much more marketable. So it's to the vendor's benefit, really. But this would all be much easier if we had had this discussion at an earlier stage, such as during vendor selection

A Model Architecture

TANDARDIZATION of business and IT processes is increasing. Many corporations are building enterprise architectures, and a number of industries have formed standards for sharing data. For example, banks use Federal Reserve standards for clearing checks. The

for communication among food manufacturers. wholesalers and retailers. Oil companies have standards that facilitate the purchase, shipment and

trading of gas and oil. The hotel industry is the first to be applying enterprise architecture concepts across an entire industry. When completed. the industry architecture (IA) will describe nearly all the business processes, applications, data and technology required to operate a hotel or resort. Hotel Technology Next Generation (HTNG), a global consortium of the industry's major stakeholders, is leading the effort.

The IA isn't envisioned as merely an agreement among IT staffers at large chains. It's an industrywide effort that must meet the needs of multiple stakeholders such as these:

■ Hotel chains, Large chains own many hotel brands. For example, Marriott includes Ritz-Carlton. Residence Inn and Fairfield Inn. The consistent business practices speci-

grocery industry uses the Uniform Communication Standard fied by the IA will help individual hotels meet various requirements established by their parent brands.

> ■ Ownership compar These provide capital to buy, operate and refurbish hotel properties. They often own hotels in multiple chains. The IA will provide consistent operational data and financial reporting across brands and chains.

■ Manage nies. These manage the hotels' day-to-day operations. The IA will help them comply with brand standards regarding all aspects of daily hotel functions, such as registration.

checkout, cleaning and maintenance. ■ Technology companies. Manufacturers and service providers supply

■ The hotel industry is the first to be applying enterprise architecture concepts across an entire industry.

IT-enabled devices and services to hotels, from guest-room consumer electronics to POS devices. By clearly specifying hotel needs, the IA will help providers target products

and services.

■ Developers. Architects and construction firms make many hardware decisions that affect hotel operations. The IA will describe capabilities required for hotel technology, such as for room locks. LAN wiring and HVAC controls

HTNG's IA will accommodate hotel properties of all sizes, from small hotels with as few as 30 rooms to large resorts with thousands of rooms and elaborate dining, conference and leisure facilities.

Since HTNG is a global consortium, the 1A will also accommodate full internationalization, including local languages, character sets, date/time formats, measurements and postal codes. It will allow for differences in laws governing subjects as diverse as taxes, food

safety, financial reporting

and passport control. HTNG's architecture working group has released the first version of the IA's business process architecture, which uses The Open Group Architecture Framework. The first version is limited to small hotels with only sleeping accommodations. Future releases will expand the architecture to include additional functions required to operate large hotels and

resorts The working group is currently specifying the applications required to support each designated business process, HTNG's application architecture is expected to be approved during the second quarter of this year.

HTNG's industry architecture will provide a template for processes and applications that can be used worldwide. An industrywide architecture will improve interactions across the hotel industry, with benefits for stakeholders. hotel employees and, ultimately, hotel guests.

Moreover, this first industry architecture may inspire other industries by providing a model that standardizes communication and informationsharing among diverse industry participants. **Bart Perkins** is managing partner at Louisville, Ky.based Leverage partners Inc., which helps organizations invest well in IT. Contact him at BartPerkins@ LeveragePartners.com

The president of Job Search Training Systems Inc. and co-author of Next-Day Job Interview and Wizard of Work explains that the time to max**imize your earnings** is during initial salary negotiations.

otiating for a higher start ing salary. How is that possible en there's so much compe on for every job? Many job seekers erroneously believe that they can't negotiate wages, benefits or perks in a night labor market for fear of losing a job offer. Because of this. many people enter new jobs feeling like they've been taken advantage of. As a result, they ultimately lose motivation to excel, which in turn means raises and/or promotions don't come

as rapidly - or not at all. Job seekers need to understand a few realities about the biring and negotiation process. First, if you don't ask for more, you will never get more. Even if you don't get everything you want, getting a little bit of something is better than getting a whole lot of nothing. If you end up with nothing, you've lost nothing. Second, compensation regoliation isn't a zero-sum game. Both parties can end up winners instead of one having to lose so the other can win. Third, the employer wouldn't be looking if it weren't in need. This puts some immediate negotiation power into the hands of the job seeker who

fits the needs of the employer. There's a belief that every employer is looking for the cheapest worker it can find. In some instances this is true, but in reality most employers realize that paying a fair and equitable wage is one of the best ways to keep good workers, maintain quality and increase productivity.

What if it's clear that there's just no wiggle room on salary? If they can't give you any more money, negotiate for things that you'd spend money for, things that make you a more valuable employee, things that enhance your quality of life or things that can be turned into money later

Examples of things you would spend money for are job-related tools, including computers and software; allowances for clothing, parking, gas and day care; or company products or promotional items the company might receive or distribute such as event tickets. You can also ask if the company gets corporate

product discounts on vehicles, credit card interest rates, food supplies. home furnishings, etc. If it does, negotiate for inclusion of these types

of things. Things that make you more valuable might include an educational allowance, or ongoing and on-theiob training (preferably in Hawaii).

Quality-of-life items include reduced travel, a day of telecommuting or a work schedule that fits around family needs.

And things that can be turned into money later include stock options. profit sharing, deferred compensation, cost-of-living increases and bonuses for exceptional work.

What sort of information should a person have at hand in order to negotiate more effectively?

A thorough knowledge of what makes you unique and a list of 30 to 60 of your most marketable skills. A list of previous accomplish-

ments and how those accomplishments benefited the prior company's bottom line.

■ Letters of recommendation from previous employers and coworkers highlighting your immediate value to the company

Asolid understanding of the needs and problems you can solve at the company to which you're applying A salary survey for people with your skills and experience in your

general work locale. ■ Considerable practice giving ver bal examples of how hiring you will benefit the company's bottom line.

Shark Tank TRUE TALES OF IT LIFE AS TOLD TO SHARKY

See, It Worked! This retail company is seeing dismal profits because of the recession, reports a pilot fish there, so management sets up a big meeting looking for ideas. "One of our fresh-faced managers suggested that part of the problem was worker productivity," says a pilot fish on the scene. "He had observed one person playing cards on her PC, and he was sure the problem was rampant throughout the compar The IT director chimed in and said this would be a perfect time to work on network security and began talking about pushing policies to the users to block games, etc." The new policy push gets a

later, it's showing results.

Workers can no longer play games on their PCs." says fish. "We can also barely do --mail, and we have problems launching needed applications such as word processing and spreadsheets. Start-up time from the log-in screen can take 15 minutes. A few people have had their systems hosed so badly that a complete rebuild was needed. But at least no one is playing games."

Gee, Thanks, Boss

It's a few years ago, when smoking was still allowed at this aerospace company, and a construction project temporarily moved the programmers right next to a group of facilities people – many of whom

smoked. "This bothered one of the programmers, who kept complaining to his manager - who said to keep escalating it," reports a pilot fish there. "The next week, this was an issue on the status report. Week after week, the programmer kept complaining to his manager until one day, the director of software engineering happened to be walking through. The manager was telling the programmer to keep writing this up as an issue, since 'the squeaky wheel gets the grease.' The director, not missing a beat as he walked by, said, 'Or replaced.'

Luckily, the new area was

Frankly speaking Frank Haves

Vista vs. Money

O VISTA OR NOT TO VISTA? If that's the question, the answer is money. Microsoft would really, really like IT shops to quit waffling and start migrating to the latest version of Windows. After all, Vista has been out for years now. It's stable. It's secure. The new software has even been paid for already under many volume licenses.

But even when that's true, the answer is still money.

It costs money to upgrade hardware. And to rebuild user desktops. And to retrain users. And to field a lot more help desk calls.

After two years, most big IT shops have already spent money testing important applications to make sure they'll run on Vista. But nobody who's still waiting has launched projects to fix custom apps that didn't pass the test. Those fix-up projects will cost money.

And at most companies, now is not a good time to ask for that money. For deploying a new PC operating system? What's wrong with the old one? No, what's really wrong with the old one — wrong enough that we can't get by without an upgrade this year?

Then there's the problem of risk — which also translates into money.

Things can go wrong

with software, and users are IT's first line of defense against bugs, slowdowns, crashes or simply very bad ideas. Users find ways around the problems and keep doing their jobs. The more familiar the software is, the better users are at that.

But a new operating system makes it harder for users to figure out successful work-arounds. Besides, every user department is shorthanded and under pressure.

There's no time for solving software problems. So fixes have to wait for IT's swamped help desk. Lost time means lost productivity and could mean lost sales or unhappy cus-

■ Nobody has to convince the CFO to keep that old rust-bucket XP running. Don't laugh – it's paid for.

tomers. In other words,

What about the cost of keeping creatyly old Windows XP running? Yes, that's money too. But even if that's as expensive as upgrading — which it almost certainly isn't — a "one more year with XP" approach doesn't require a budget line item for the upgrade. Nobody has to convince the CFO to keep that old rush-bucket XP running. Don't laugh — it's paid for.

Money, money, money; that's us.

Microsoft should understand that — just as we understand why Microsoft has started to push Vista with arguments ranging from the sincere to the screwy. (No, Steve Ballmer, most users won't ask their boss why they can't get Vista at work this year; they just want to keep getting a powheek this wear.)

For Microsoft, it's about money too. Whether or not the rumors are true that Windows 7 will arrive by the end of 2009, Microsoft needs to turn the crank on sales right now. And right now, Vista is the only game Microsoft have

But for us, it's not the

only game in town.
Look, we love making product decisions
based on business value
or technical quality, cute
TV ads or product maturity. We may make bad
choices, but we like hav-

ing the choice to make. But right now, for us, the to-Vista-or-not question isn't about improved security or glitzy transparent windows. It's not about Jerry Seinfeld or Mojave. It's not even about whether Vista is about to become obsolete, especially for I's thops still supporting a 2001 version of Windows that Microsoft is trying hard to make unsupportable.

It's about money the money that IT can't get for a Vista upgrade. That's the simple, brutal reality we're facing.

And until that answer changes, there's really no Vista question at all.
